Iteration: 1 - login ⌄

REQUEST DESCRIPTION

I have implemented a suite of **Postman Tests** to verify the response quality. You can see the results in the **Test Results (5/5)** tab. The logic covers:

- **Basic Connectivity:** Checks if the status is exactly `200 OK`.

- **Performance Benchmark:** Verifies the response time is under `1000ms` to ensure a smooth user experience.

- **Identity Verification:** Specifically checks if the `username` returned is `emilys` and the email contains the correct domain.

- **Auth Security:** Confirms that the `accessToken` is a valid string and not empty before saving it to the environment.

- **Data Structure (Schema):** A strict check on the JSON keys (id, email, gender, etc.) to catch any breaking changes in the backend response.

Iteration: 1 - Refresh auth session ⌄

REQUEST DESCRIPTION

The primary goal of this script is to validate the token renewal process and ensure the seamless automation of the testing collection by updating global variables dynamically.

2. Detailed Assertion Breakdown

- **Status Code Validation**

- **Code:** `pm.test("Status code is 200", function () { ... });`

- **Description:** This test ensures that the server successfully processed the request. A **200 OK** status confirms that the provided `refreshToken` is valid and the session has been extended.

- **Performance / Response Time Check**

- **Code:** `pm.test("Response time is less than 1000ms", function () { ... });`

- **Description:** This verifies the API efficiency. For a high-quality user experience, the renewal process must complete in under one second (1000ms).

Iteration: 1 - search users by name ⌄

REQUEST DESCRIPTION

- **Request Name:** Search Users by Name.

- **Method:** GET.

- **Endpoint:** https://dummyjson.com/users/search?q=Michael.

- **Description:** This request tests the API's ability to filter the user database based on a search query. It ensures that only relevant records containing the keyword "Michael" are returned.

- **Key Validations:**

- **Functional:** Verifies that the `firstName` of every user in the results matches the query.

- **Performance:** Confirms the search operation completes within the required time limit (< 1000ms).

- **Integrity:** Checks that pagination metadata (`total`, `skip`, `limit`) is included in the response.

REQUEST DESCRIPTION

Delete User by ID

Overview

This endpoint performs a **soft delete** operation on a user account. Instead of permanently removing the user record from the database, it marks the user as deleted by setting the isDeleted flag to true and recording the deletion timestamp in deletedOn.

Iteration: 1 - Update Product Price Only ⌄

REQUEST DESCRIPTION

This endpoint allows you to update **only the price** of a specific product without modifying any other product attributes. It uses the PATCH method for partial updates.

HTTP Method

PATCH - Used for partial resource updates. Unlike PUT which replaces the entire resource, PATCH only modifies the specified fields.

Endpoint

```
PATCH https://dummyjson.com/products/{id}

Iteration: 1 - Get carts ⌄

REQUEST DESCRIPTION

This endpoint retrieves cart information from the DummyJSON API. It returns a paginated list of shopping carts with detailed product information, pricing, and discount calculations.

Response Structure

The response contains the following main fields:

- **carts** (array): An array of cart objects containing all cart data

- **total** (number): The total number of carts available

- **skip** (number): The number of carts skipped (for pagination)

- **limit** (number): The maximum number of carts returned per request

Cart Object Structure

Each cart in the carts array contains:
